

Ayush Verma

Full Stack Developer (MERN) | Node.js | React.js | System Design
Noida, India | +91-9616777406 | Ayushnishu407@gmail.com | GitHub | LinkedIn

Summary

Full Stack (MERN) Developer with nearly 3 years of experience building scalable SaaS platforms and real-time systems. Built and scaled backend systems processing thousands of real-time events daily for a 5,000-user platform; cut API failures 35% and load times 70% through caching, query optimization, microservices design, and CI/CD-driven deployment pipelines.

Skills

Languages: JavaScript, TypeScript

Frontend: React.js, Next.js, Mantine UI, ShadCN/UI

Backend: Node.js, Express.js, REST APIs, WebSockets, Microservices

Databases: PostgreSQL, MongoDB, Redis

Cloud & DevOps: AWS (Lambda, EC2, S3), Firebase, Vercel, Docker, CI/CD, Git, GitHub

Concepts: System Design, Caching, JWT, RBAC, Multi-Tenant Architecture, Unit & Integration Testing

Experience

Full Stack Engineer

Jan 2026 – Present

Manufac Analytics Pvt. Ltd.

- Cut data synchronization delays by 30% by re-architecting low-latency backend services with PostgreSQL real-time subscriptions.
- Increased UI responsiveness by 40% by normalizing state management and optimizing rendering for large KPI datasets.
- Reduced production API failures by 35% by implementing caching and rate-limiting strategies for high-concurrency traffic.

Full Stack Engineer

Oct 2023 – Jan 2026

Smalsus Infolab Pvt. Ltd.

- Improved system throughput by 40% under load by designing and scaling REST APIs for high-frequency business workflows.
- Reduced application load times by 70% by optimizing asset delivery and implementing CI/CD-driven build pipelines.
- Cut API latency from 2 seconds to under 300ms by implementing SQL indexing, optimizing slow queries, and reducing payload sizes.
- Maintained 99.9% uptime across production environments by deploying and managing services on EC2 and S3 with automated CI/CD pipelines.

Projects

Medoly (Medical Claims SaaS Platform)

React 19, TypeScript, Mantine UI, TanStack Query, AWS Amplify

- Architected a scalable, type-safe frontend application with a focus on long-term maintainability by enforcing strict component modularity and decoupled business logic.
- Engineered an advanced RBAC system supporting dynamic read-only UI configurations for global auditor roles and multi-step tenant registration workflows.
- Optimized data fetching for a real-time claims review dashboard, reducing redundant network calls and accelerating UI updates by managing complex server state with TanStack Query and Zod.

Culture Booster (Employee Engagement Portal)

Next.js, Supabase, Docker, GitHub Actions, Cron Jobs

- Enabled seamless, zero-downtime production releases by containerizing a full-stack Next.js and Supabase application with Docker and an automated GitHub Actions CI/CD pipeline.
- Eliminated manual survey scheduling by engineering backend cron jobs to dynamically trigger and dispatch targeted employee lifecycle surveys (onboarding, 30-day, offboarding).
- Reduced API response times and built an interactive analytics dashboard with KPI visualizations backed by optimized database queries.

Internal Timesheet Management System

React.js, Typescript, Firebase

- Engineered end-to-end Timesheet and Project management modules, streamlining internal resource tracking and project allocation workflows.
- Secured database operations and enforced strict data validation by writing custom Firebase Security Rules, ensuring isolated data access across different employee and administrative roles.
- Improved internal operational efficiency by digitizing manual timesheet entries and centralizing project tracking into a single unified dashboard.

Education

Master of Computer Applications (MCA)

2021 – 2023

IPEM Group of Institutions

CGPA: 7.6
